## Radiology On Call

A Primer for New Residents

Jonathan Chung, MD, FRCPC Interventional Radiologist Radiology Undergraduate Medical Education Director Interventional Radiology Fellowship Director

## Goals

- 1. "Put a face to a name"
- 2. Provide a resident's point of view
- 3. Offer a basic framework of issues to consider when ordering imaging

## Outline

- Introduction to the Radiology Residents AKA "The Outsiders"
- Getting what you need on call AKA "Mission: Impossible"
- Radiation AKA "Risky Business"
- Contrast Reactions AKA "Cocktail"

- 21 Residents
- PGY1 rotating internship

PGY?s

Fateme Salehi Queens

Joel Mercer MUN

Eugenia Khorachkov MUN

PGY5s

Sohaib Munir Queens

Vinod Ramlal McMaster

PGY4s

David Wang UofT

Peter Lynch UofT

PGY3s

lan Chan Saskatchewan

Arthur Wozniak Western

PGY2s

### Basics

- Weekdays 5pm 8am
- Weekends & Holidays
- Typically 1 resident on call, 1 on backup
- When in doubt: page the radiology resident on call for that hospital

### Work Load

- Average approximately 40 cross-sectional studies/night
- Turn around time < 1 hour
- Strokes/traumas subject to even stricter timelines

- So, you're ready to order a study.
  - What is the clinical question I am trying to answer?
  - Is the study indicated?
    - Do the potential benefits outweigh costs/risks?
    - Will this study change management overnight/over the weekend?
  - Is this the right test?

- The Menu
  - CT, MR, US, interventional radiology, fluoroscopy
  - Radiography
  - IV Contrast
    - Yes or No?
    - Timing
    - Number of phases
  - Oral Contrast
    - Yes or No?

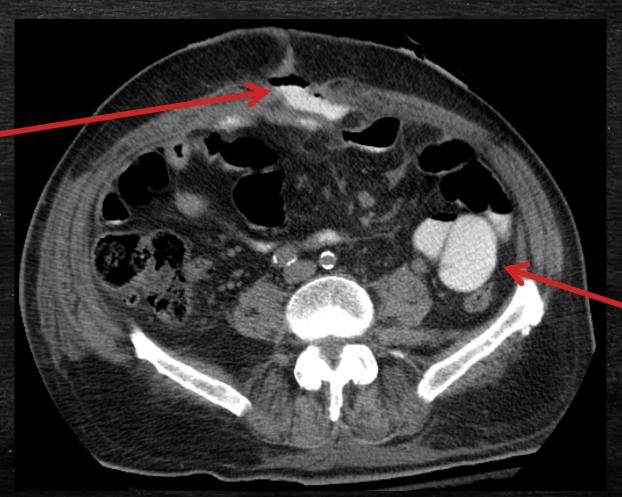

Without Contrast

With Contrast

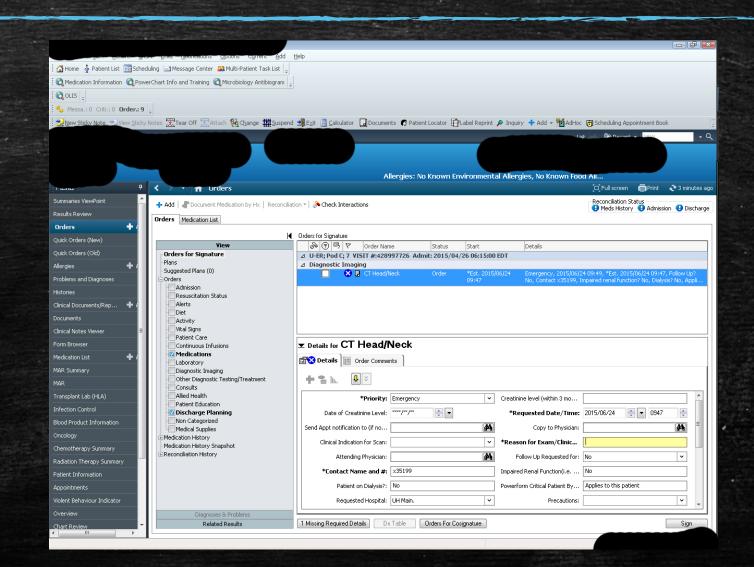

Oral Contrast

Extravasated Oral Contrast

Oral Contrast in Bowel

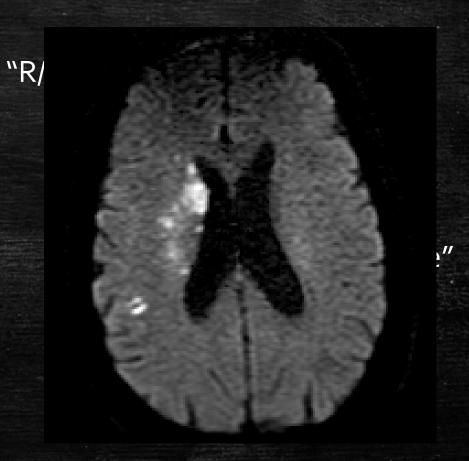

Ordering

The Importance of a Good History

Hyperdense Dot

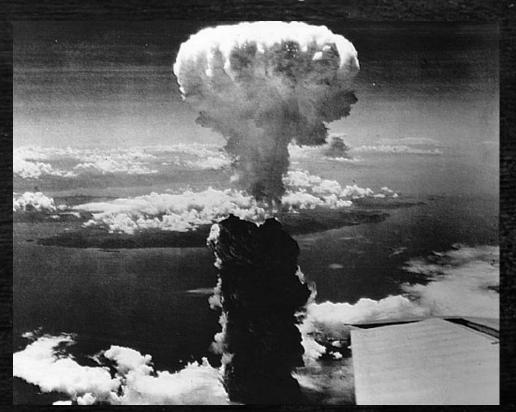

- Tips (take them for what they're worth)
  - Approach every study as a consult, not an order
  - Provide an accurate and succinct history (HMHY)
  - Page, don't call
  - We love guests

## Radiation

- Ionizing Radiation -> Nuclear DNA damage
  - Unrepaired or misrepaired DNA can cause mutations and carcinogenesis
- How bad is it?
  - We're not quite sure
  - Much less than 1% but not zero

## Radiation - Risky Business

The Opinion Pages | OP-ED CONTRIBUTORS

### We Are Giving Ourselves Cancer

By RITA F. REDBERG and REBECCA SMITH-BINDMAN JAN. 30, 2014

DESPITE great strides in prevention and treatment, <u>cancer</u> rates remain stubbornly high and may soon surpass heart disease as the leading cause of death in the United States. Increasingly, we and many other experts believe that an important culprit may be our own medical practices: We are silently irradiating ourselves to death.

The use of medical imaging with high-dose radiation — CT scans in particular — has soared in the last 20 years. Our resulting exposure to medical radiation has increased more than sixfold between the 1980s and 2006, according to the National Council on Radiation Protection & Measurements. The radiation doses of CT scans (a series of X-ray images from multiple angles) are 100 to 1,000 times higher than conventional X-rays.

Of course, early diagnosis thanks to medical imaging can be lifesaving. But there is distressingly little evidence of

## The New York Times

"...the National Cancer Institute estimates that CT scans conducted in 2007 will cause a projected 29,000 excess cancer cases and 14,500 excess deaths over the lifetime of those exposed."

## Radiation – Risky Business

- Additional Considerations
  - Pediatric Patients
    - Risks are magnified
    - Mortality risk for abdominal CT
      - 15 year-old 1/1400
      - 5 year-old 1/1100
      - Toddler 1/700
  - Pregnancy
  - High-risk for further imaging

### Imaging overutilisation: Is enough being done globally?

Rehani B, MD

Department of Radiology, University of Cincinnati, OH

Received 30 December 2009; received in revised form 19 May 2010, accepted 26 May 2010

The discovery of X rays by Roentgen in 1895 was one of the greatest discoveries with historical impact on on each and every one of us. The ability to view anatomy and infer function of inner organs and tissues of human body has provided immense potential that have led imaging to therapeutic arena through interventions and follow-up. How much imaging is appropriate is a legitimate question to ask. This stems from recent emphasis on overutilisation of medical imaging [1–2]. Overutilisation of imaging has been defined as any application where imaging is unlikely to improve patient outcome. Being a probabilistic situation the uncertainties

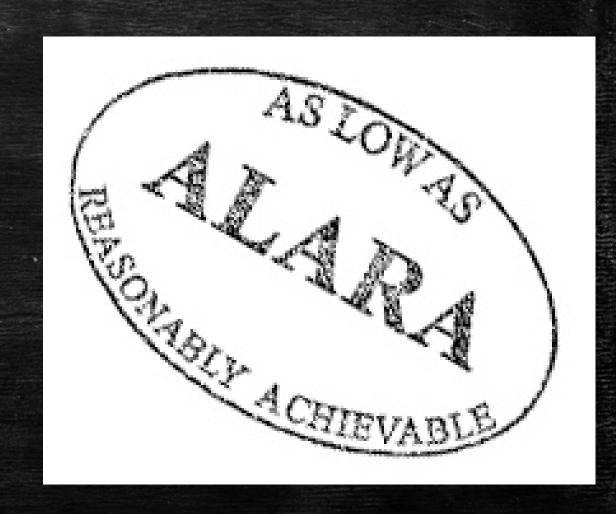

What has not been commented on is the difference between developed and developing countries. While overutilisation is becoming a problem for developed countries, lack of access remains an issue in a large part of the third world, despite the fact that there has been an increase in the rate of growth and unnecessary radiation dose to patients, in a number of developing countries, undergoing computed tomography (CT) and interventional procedures [9–10]. Even though access is limited in developing countries, inappropriate utilisation of imaging modalities still exists. While defensive medicine and self-referral are relatively minor or

"...a significant fraction (perhaps 20 to 50 percent in some areas) of radiological examinations may be inappropriate."

## Radiation – Risky Business

Canadian Association of Radiologists

Consensus Guidelines for the Prevention of Contrast Induced Nephropathy

AKA Contrast-Associated Acute Kidney Injury

### GENERAL GUIDELINE FOR ALL PATIENTS WITH EGFR <60 mL/min:

- Avoid Dehydration
- Consider alternate Imaging studies not requiring iodinated contrast medium
- Minimize contrast medium volume
- Avoid repeat iodinated contrast studies within especially within 48 hours
- Use low- or iso-osmolar non-ionic contrast medium
- ♦ eGFR < 45 mL/min AND
- Intravenous Contrast Administration

### MILD-MODERATE RISK OF CIN

- ♦ IV hydration
- Avoid dehydration (Oral fluids if IV hydration impractical)
- ♦ f/u SCr and eGFR in 48 72 hrs.

- ♦ eGFR < 60 mL/min AND</p>
- ♦ Intra-arterial Contrast Administration
- OR any eGFR w/ acute illness, unstable renal function or inpatients

### MODERATE-HIGH RISK OF CIN

- Hold nephrotoxic drugs (esp. NSAIDs and diuretics),
- Hydrate with IV NACl or NaHCO3
- Consider NAC
- f/u SCr and eGFR in 48 − 72 hrs.

### PERI-PROCEDURAL FLUID ADMINISTRATION PROTOCOLS

### IV FLUID

1. 0.9% NaCl @ 1 mL/Kg/hr for 12 h pre and for 12 hr post contrast administration

### for same day examinations:

2. isotonic NaCl or NaHCO3 @ 3 mL/kg/hr for 1-3 hr pre and for 6 hr post contrast administration

### 0

- 3. NaHCO3 150 meq in 850 mL D5W @ 3 mL/kg/hr for 1 hr pre and @ 1 mL/kg/hr for 6 h post contrast administration
- Depending on the patient's weight, at least 300 to 500 mL of IV fluids should be received before contrast is administered

- Acute Contrast Reactions
  - For low osmolar contrast media
    - Overall prevalence 3.13%
    - Severe reactions 0.04%
  - Pre-medication regimens available for those with a history of previous reactions

How to treat?

Safety Essentials: Acute Reactions to Iodinated Contrast Media

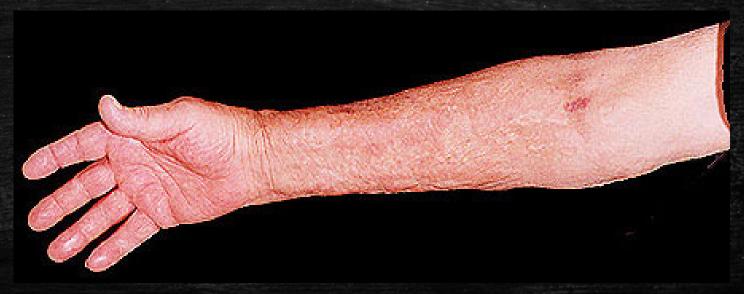

Ramesh S. Iyer, MD\*, Jennifer G. Schopp, MD, Jonathan O. Swanson, MD, Mahesh M. Thapa, MD, Grace S. Phillips, MD

Department of Radiology, Seattle Children's Hospital and the University of Washington, Seattle, Washington, USA

### Abstract

The objectives of this article are to review the diagnosis and management of acute nonrenal reactions to iodinated contrast media. We will begin by discussing the types of contrast media and their correlative rates of reaction. The mechanism of contrast reactions, predisposing risk factors, and preventative measures will then be discussed. The remainder of the article will review the assessment of potential reactions, initial management, and treatment algorithms for specific reactions.

- Nephrogenic Systemic Fibrosis (NSF)
  - Rare manifestation of gadolinium administration
  - Irreversible fibrosis of the skin and organs
  - Generally, not concerned unless eGFR < 30 mL/min/1.73m2

NSF involving the skin of the forearm

## **Intracranial Gadolinium Deposition** after Contrast-enhanced MR Imaging<sup>1</sup>

Robert J. McDonald, MD, PhD Jennifer S. McDonald, PhD David F. Kallmes, MD Mark E. Jentoft, MD

David L. Murray, MD, PhD

Kent R. Thielen, MD

Eric E. Williamson, MD

Laurence J. Eckel, MD

**Purpose:** 

To determine if repeated intravenous exposures to gadolinium-based contrast agents (GBCAs) are associated with neuronal tissue deposition.

**Materials and** Methods: In this institutional review board-approved single-center study, signal intensities from T1-weighted magnetic resonance (MR) images and postmortem neuronal tissue samples from 13 patients who underwent at least four GB-

Radiology

"...intravenous administration of GBCA is associated with dose-dependent deposition in neuronal tissues that is unrelated to renal function, age, or interval between exposure and death."

## Take Home Points

- Imaging utilization is a complex issue deserving of continuous consideration of the potential benefits, harms and costs.
- We are all here to help patients.
  Radiology exists to help you. Let's be good to each other.
